

The obsolete `everyshi` package*

Martin Schröder†

2020/11/18

Why you should no longer use this package:

This packages provides hooks into `\sshipout` called `\EveryShipout` and `\AtNextShipout` analogous to `\AtBeginDocument`.

With the introduction of the \LaTeX hook management this package became obsolete in 2020. Information on their usage can be found in the the corresponding documentation for `lthooks`[1] and `ltshipout`[2]. We only provide this package to allow backwards compatibility. For current versions of \LaTeX it's only mapping the hooks to the original `everyshi` macros. In case you use an older \LaTeX format, `everyshi` will automatically fallback to its' old implementation by loading `everyshi-2001-05-15`.

*The version umber of this file is v4.00, last revised 2020/11/18.
The name `everyshi` is a tribute to the 8+3 file-naming convention of certain “operating systems”; strictly speaking it should be `everyshipout`.

†maintained by Marei Peischl

1 Introduction

This package provides the hooks `\EveryShipout` and `\AtNextShipout` whose arguments are executed after the output routine has constructed `\box255`, and before `\shipout` is called.

2 Usage

`\EveryShipout{<code>}` declares `<code>` that is saved internally and executed before each `\shipout`.

Warning: The `<code>` is saved globally; there is currently no way to remove it.

`\AtNextShipout{<code>}` declares `<code>` that is saved internally and executed just before *only the next* `\shipout`.

The `<code>` is executed after `\box255` has been constructed by the output routine and can change `\box255`. `\shipout` is called *after* `<code>`.

Repeated use of the commands is permitted: the code in the argument is stored (and executed) in the order of their declarations.

The argument of `\AtNextShipout` is executed *after* the argument of `\EveryShipout`.

3 Options

The package has no options.

4 Required packages

The package does not require any further packages.

5 The implementation

```

1 <*package>
2 \providecommand\IfFormatAtLeastTF{\@ifl@t@r\fmtversion}
3 \IfFormatAtLeastTF{2020/10/01}{-}{\input{everyshi-2001-05-15.sty}}
4 \IfFormatAtLeastTF{2020/10/01}{-}{\endinput}
5 \protected \def \EveryShipout  {\AddToHook{shipout/before}}
6 \protected \def \AtNextShipout {\AddToHookNext{shipout/before}}
7 </package>

```

5.1 The original implementation by Martin Schröder

To provide compatibility for older L^AT_EX formats we wrap the original implementation of everyshi version 3.00 into the fallback package everyshi-2001-05-15.

```

8 *fallback
9 \ProvidesPackage{everyshi-2001-05-15}
10 [2020/11/18 v4.00 EveryShipout Package (fallback mechanism)]

```

5.2 Allocations

First we allocate the hooks

```

\@EveryShipout@Hook The code to be executed before \shipout is stored in \@EveryShipout@Hook.
11 \newcommand{\@EveryShipout@Hook}{}

```

```

\@EveryShipout@AtNextHook The code to be executed just before the normal \shipout and
\@EveryShipout@EveryHook.
12 \newcommand{\@EveryShipout@AtNextHook}{}

```

5.3 The user-visible commands

```

\EveryShipout The commands are modeled after \AtBeginDocument.
\AtNextShipout
13 \newcommand*{\EveryShipout}[1]
14   {\g@addto@macro\@EveryShipout@Hook{#1}}
15 \newcommand*{\AtNextShipout}[1]
16   {\g@addto@macro\@EveryShipout@AtNextHook{#1}}

```

5.4 Inserting the hooks

We want to redefine `\shipout` so that first `\box255` is constructed and after that we can do something and at last shipout the (possible modified) `\box255`. Alas, this does not work in the usual way, since `\shipout` is a T_EX primitive whose argument is a *⟨box⟩*. This means that simply redefining `\shipout` via `\newcommand[1]` is impossible since *⟨box⟩* can be something like `\box255` or something like `\vbox{...}`. In the first case `#1` would be *⟨\box⟩* (without *⟨255⟩*); in the second case it would be *⟨\vbox⟩* (without *⟨{...}⟩*). The solution we use here is borrowed from `quire.tex` by Marcel R. van der Goot. It is based upon `\afterassignment` and `\aftergroup`.

```

\@EveryShipout@Shipout \@EveryShipout@Shipout is our replacement for \shipout.
17 \newcommand{\@EveryShipout@Shipout}{%
18   \afterassignment\@EveryShipout@Test
19   \global\setbox\@cclv= %
20   }

```

`\box255` is set to whatever comes after `\shipout`; but after that assignment `\@EveryShipout@Test` is called.

`\@EveryShipout@Test` `\@EveryShipout@Test` determines if `\shipout` is called with an argument like `\box255` or something like `\vbox{...}`. In the later case we delay the call of `\@EveryShipout@Output` (where the original `\shipout` is called) via `\aftergroup`.

```

21 \newcommand{\@EveryShipout@Test}{%
22   \ifvoid\@cclv\relax
23     \aftergroup\@EveryShipout@Output
24   \else
25     \@EveryShipout@Output
26   \fi%
27   }

```

`\@EveryShipout@Output` `\@EveryShipout@Output` does the actual work. First the *code* accumulated via `\EveryShipout` and `\AtNextShipout` is called and then the original `\shipout` stored in `\@EveryShipout@Org@Shipout` is called to finally ship out `\box255`.

```

28 \newcommand{\@EveryShipout@Output}{%
29   \@EveryShipout@Hook%
30   \@EveryShipout@AtNextHook%

```

We have to reset `\@EveryShipout@AtNextHook` after each use.

```

31   \gdef\@EveryShipout@AtNextHook{}%
32   \@EveryShipout@Org@Shipout\box\@cclv%
33   }

```

`\@EveryShipout@Org@Shipout` The original `\shipout` is stored in `\@EveryShipout@Org@Shipout` by `\@EveryShipout@Init`. Here we allocate it.

```

34 \newcommand{\@EveryShipout@Org@Shipout}{}

```

`\@EveryShipout@Init` `\@EveryShipout@Init` stores the original `\shipout` in `\@EveryShipout@Org@Shipout` and sets `\shipout` to `\@EveryShipout@Shipout`. This is done at `\begin{document}` via `\AtBeginDocument`.

```

35 \newcommand*{\@EveryShipout@Init}{%
36   \message{ABD: EveryShipout initializing macros}%
37   \let\@EveryShipout@Org@Shipout\shipout
38   \let\shipout\@EveryShipout@Shipout
39   }
40 \AtBeginDocument{\@EveryShipout@Init}
41 </fallback>

```

6 Acknowledgements

Thanks to Ulrike Fischer for the advice during preparation of Version 4.00. Version 2.0 of `everyshi` borrows heavily from `quire.tex` of the Midnight Macros by Marcel R. van der Goot (marcel@cs.caltech.edu). The pointer to `quire` was provided by Lothar Meyer-Lerbs (TeXsatz@zfn.uni-bremen.de). As usual Rebecca Stiels improved the quality of this documentation.
